Adyen teams up with Meal Ticket to digitise distributor payments

Food service distribution still runs on phone orders, paper invoices, and a lot of chasing for cheques. Meal Ticket, a SaaS player serving this niche, is plugging Adyen's rails into its platform so distributors can accept cards and ACH, send pay-by-link invoices, and see everything reconcile in one place. Why it matters: B2B collections are a cash flow drag. Embedded payments can shrink days sales outstanding, cut errors, and give operators real-time visibility on who's paid. It also unlocks richer transaction data, which can mean better rates and fewer disputes. For Meal Ticket, payments aren't just a feature—they're a new revenue stream via take rates and value-added services. For Adyen, it's another vertical beachhead in B2B embedded finance, a segment less crowded than consumer POS and ripe for digitisation. The competitive takeaway: while restaurant tech has focused on the front-of-house (think POS), back-of-house money movement is getting modernised too. If adoption sticks, expect smoother cash cycles for distributors and more TPV flowing through Adyen's pipes.

Square rings up its first in-store Bitcoin sale at Compass Coffee

A latte just met the blockchain. Compass Coffee in Washington, D.C. became the first store to accept a bitcoin payment using Square's new point-of-sale, marking Block's latest move to push crypto beyond apps and into real-world tills. Why it matters: If Square can make paying with bitcoin feel as simple as tapping a card, merchants get a new tender type without adding clunky hardware or separate apps. The potential perks include lower processing costs, no chargebacks, and a small but vocal customer base eager to spend crypto. The catch is familiar—price volatility, consumer tax headaches, and compliance questions. For payment execs, the real signals lie in the plumbing: Does Square settle merchants in USD or BTC? How do refunds work? What fees apply versus card interchange, and who absorbs FX risk? Square's seller network gives it instant distribution; flip a software switch and thousands of SMBs could trial crypto at checkout, even if volumes remain modest. For card networks, it's a gentle nudge that alternative rails are edging into everyday purchases. For everyone else, it's an experiment—one latte at a time—that could reshape tender mix if the experience proves seamless.
